HACK APERTUS LIEBEFELD · CHALLENGE 2 · OPENPARLDATA

ParlTopics

Every affair. Every parliament. One shared set of topics — with Apertus.

Team Dreamers — Eduan Roci, Lirim Zahiri, Mouad Medini

The data is open. Its topics are not.

326'396

affairs in OpenParlData

97

parliaments: federal, cantonal, municipal

4

languages: de, fr, it, rm

No shared classification. Finding every digitalisation affair means guessing keywords in four languages — «eBau» also finds «Städtebau».

Source: OpenParlData bulk export, 19.10.2026 · DVS today tracks digitalisation affairs by hand

One service, two ways to ask

MODE 1 · FIXED SCHEME

Année Politique Suisse

165 topics in 22 chapters, in SKOS with DE/FR/IT/EN labels. Up to 3 topics per affair.

MODE 2 · AD-HOC

Your own topic

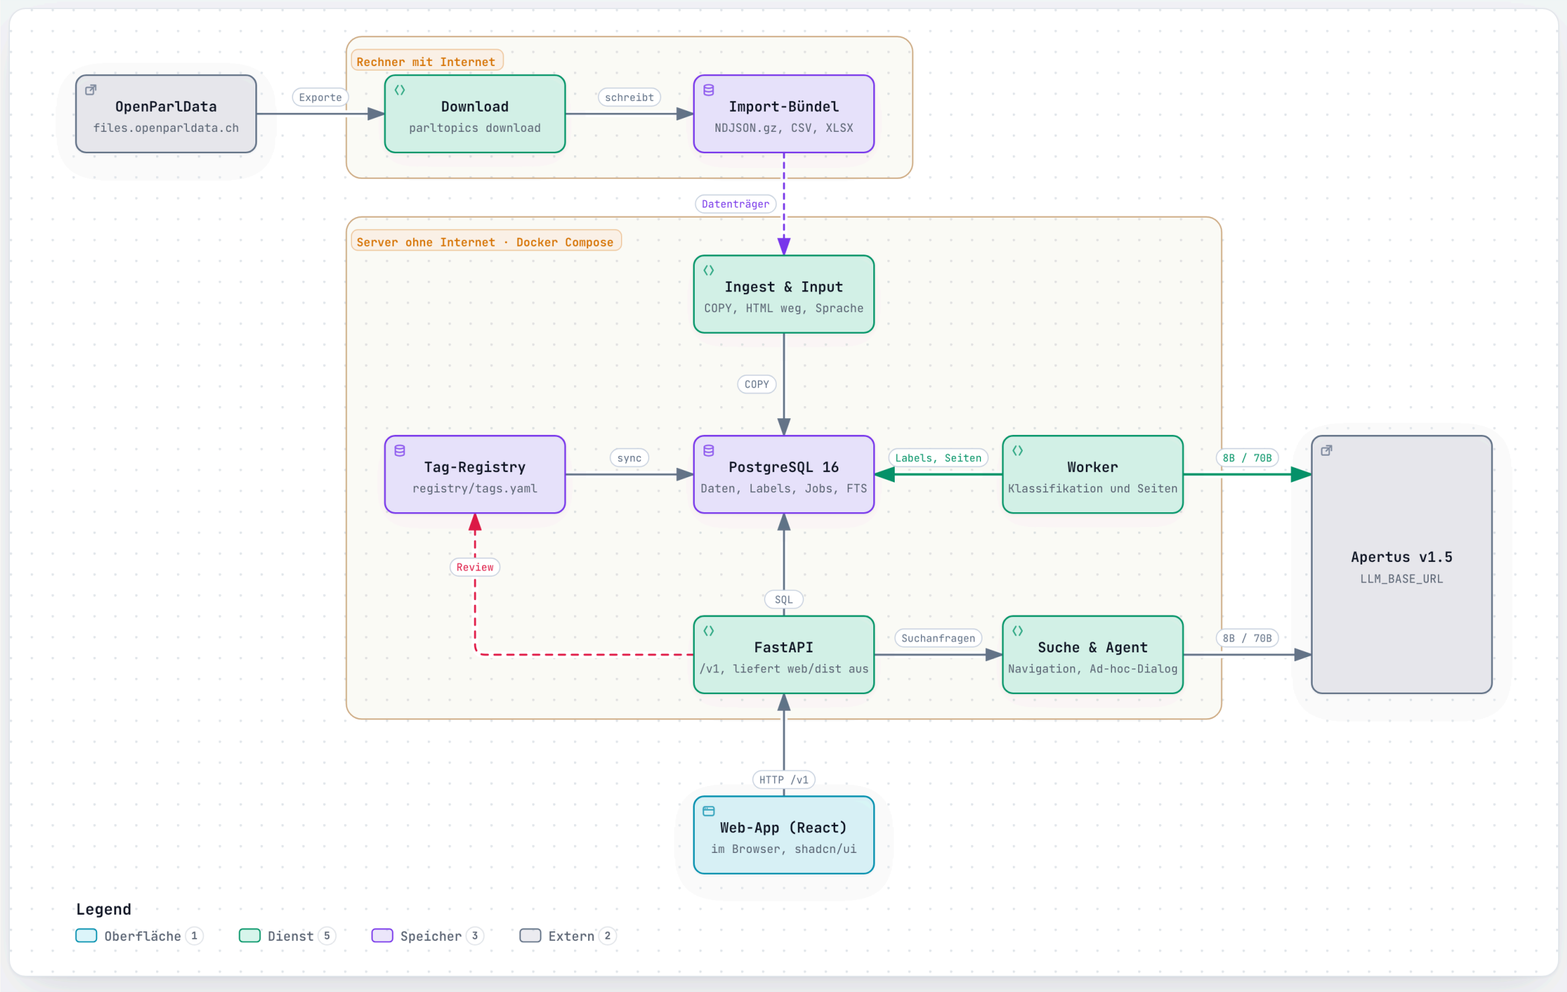

«Digitalisierung», «Velowege»: one sentence, keywords in DE/FR/IT by Apertus, no retraining.

EVERY LABEL CARRIES

Topic · confidence · verbatim quote, checked against the text · model, prompt and registry version

Outputs: REST API, search and agent, ParlWiki, affair_topics.ndjson.gz sidecar, DVS list (CSV)

How it works

docs/architecture/01-systemarchitektur.html · Python, PostgreSQL 16 job queue, FastAPI, React

Apertus 70B, one affair per call

Cannot invent topics

Strict JSON schema: the tag field is an enum of the 165 offered topics.

Quote first, then the tag

The quote is checked against the source text; unverified quotes halve the confidence.

Rules before the model

Swearing-in, resignations, naturalisations, budgets: labelled by title rule, no LLM call.

Same model, more jobs

Ad-hoc keywords in DE/FR/IT, a read-only tool-calling agent, ParlWiki summaries.

Apertus v1.5 70B via OpenAI-compatible endpoint · prompt classify_single_v3 · 8B two-stage mode kept for small hardware

Measured against the Parliamentary Services

84.6%

70B single pass: at least one hit with Curia Vista

72.7%

8B two-stage

Federal affairs	n	Result
70B, 500 newest federal affairs	499	87.5% hit
+ title rules, topics vs. institutions	1'000	top-2 91.0%

parltopics eval --curia · APS chapters mapped to the 28 Curia Vista subject areas · target 75%

15 minutes, live, all three levels

2'678

affairs labelled, 0 failed

175/min

9.8 s median per affair, 36 in parallel

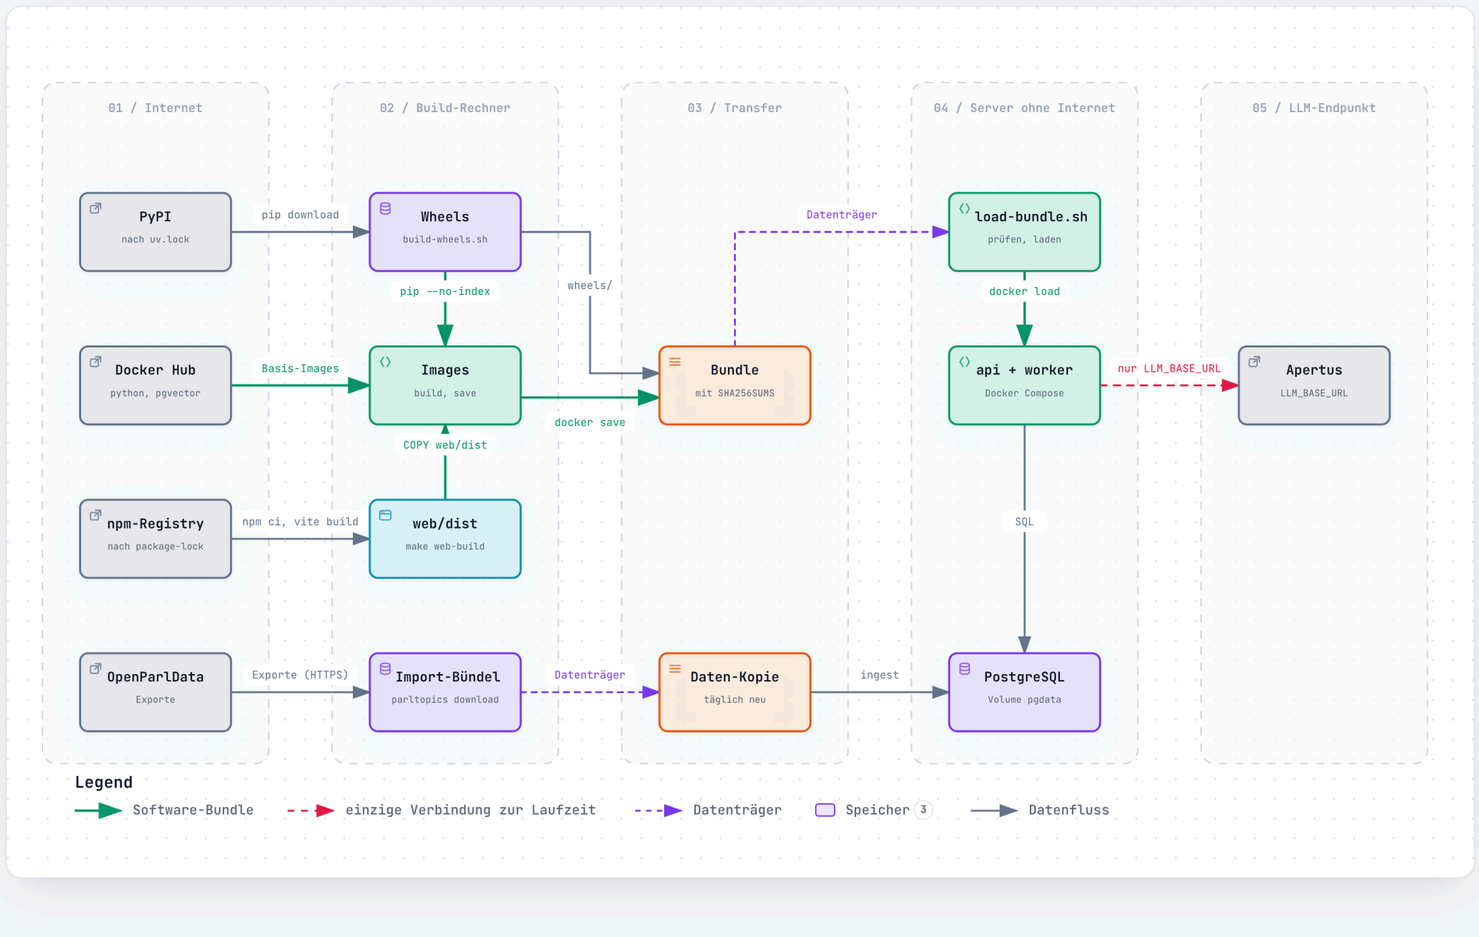

~31 h

for all 326'000 affairs on one endpoint

Level	Affairs	≥ 1 label (de / fr / it)	Quote verified
Federal	774	93 / 96 / –	95.7–98.7%
Cantonal	1'438	94 / 92 / 89	92.0–96.3%
Municipal	466	95 / 96 / 95	93.5–96.7%

Run 19.10.2026, 14:06–14:22 · runs 36–38 · current prompt v3: 84.5% Curia hit on its 684 federal affairs

Runs air-gapped. One allowed host: Apertus.

Target b) air-gapped, also a) on-premise and c) Swiss cloud · client allowlist · make offline-test proves no outbound route

Labels are suggestions. Humans decide.

Explainable

Confidence and the verified quote on every label, in the UI and the export.

Human in the loop

Confirm, reject, replace, undo. Human decisions win over every rerun.

Bias checked

Evaluation split by language, parliament level, canton and party.

Neutral, grounded agent

Read-only tools. 20 of 20 test answers cite only affairs the tools returned.

Labels are never deleted, only their status changes · new tags proposed by the model need review

With four more weeks

01 Full run over all 326'000 affairs, then daily updates

02 DVS digitalisation recall on the 30 DVS and 3'433 PolitMonitor affairs

03 Cantonal gold labels (SG, TG, Zug, ZH) mapped to APS

04 Sidecar file served next to the OpenParlData API
